- Video streaming, CDNs
- Socket programming

Pure P2P architecture

- no always-on server
- arbitrary end systems directly communicate
- Peers request service from other peers, provide service in return to other peers
 - Self scalability new peers bring new service capacity, and new service demands
- peers are intermittently connected and change IP addresses

examples:

 P2P file sharing (BitTorrent), Streaming (KanKan), VoIP (Skype)

File distribution: client-server vs P2P

Question: how much time to distribute file (size F) from one server to N peers?

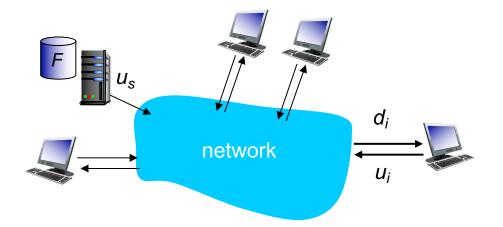

peer upload/download capacity is limited resource

File distribution time: client-server

- server transmission: must sequentially send (upload) N file copies:
 - time to send one copy: F/u_s
 - time to send N copies: NF/u_s
- client: each client must download file copy
 - d_{min} = min client download rate
 - min client download time: F/d_{min}

time to distribute F to N clients using client-server approach

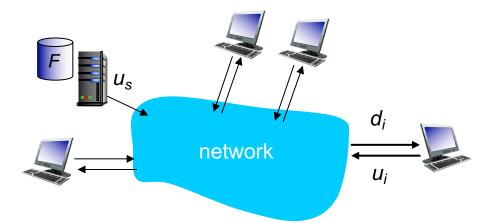

increases linearly in N

 $D_{c-s} \geq max\{NF/u_s, F/d_{min}\}$

File distribution time: P2P

- server transmission: must upload at least one copy
 - time to send one copy: F/u_s
- client: each client must download file copy
 - min client download time: F/d_{min}

- clients: as aggregate must download NF bits
 - max upload rate (limiting max download rate) is $u_s + \Sigma u_i$

time to distribute F to N clients using P2P approach

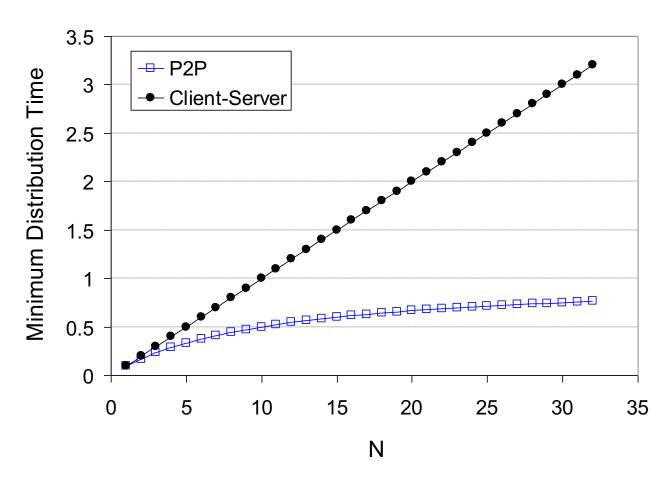

$$D_{P2P} \ge max\{F/u_{s,}, F/d_{min,}, NF/(u_s + \Sigma u_i)\}$$

increases linearly in N ...

... but so does this, as each peer brings service capacity

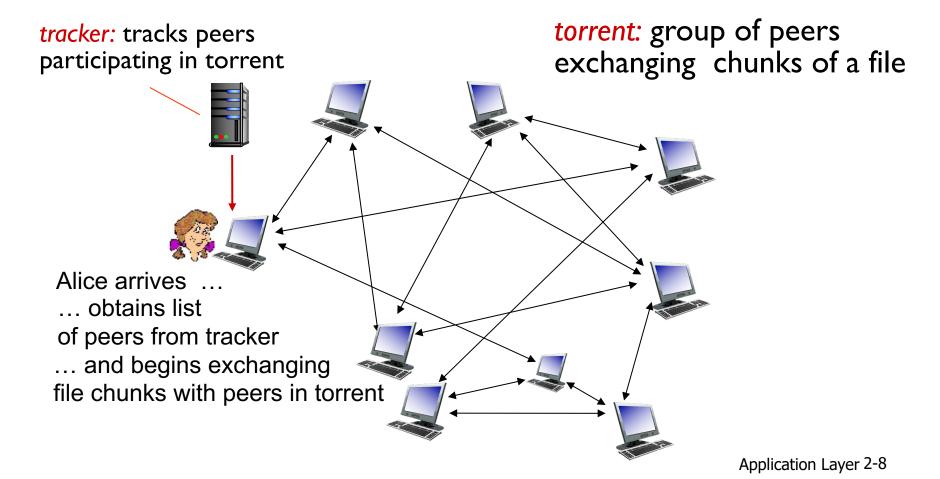

Client-server vs. P2P: example

client upload rate = u, F/u = 1 hour, $u_s = 10u$, $d_{min} \ge u_s$

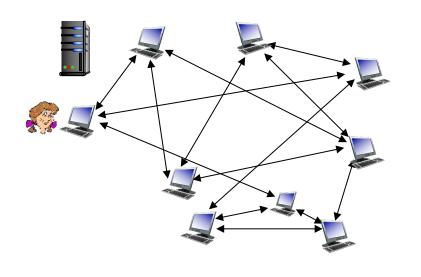

P2P file distribution: BitTorrent

- file divided into 256Kb chunks
- peers in torrent send/receive file chunks

P2P file distribution: BitTorrent

- peer joining torrent:
 - has no chunks, but will accumulate them over time from other peers
 - registers with tracker to get list of peers, connects to subset of peers ("neighbors")

- while downloading, peer uploads chunks to other peers
- peer may change peers with whom it exchanges chunks
- churn: peers may come and go
- once peer has entire file, it may (selfishly) leave or (altruistically) remain in torrent

BitTorrent: requesting, sending file chunks

requesting chunks:

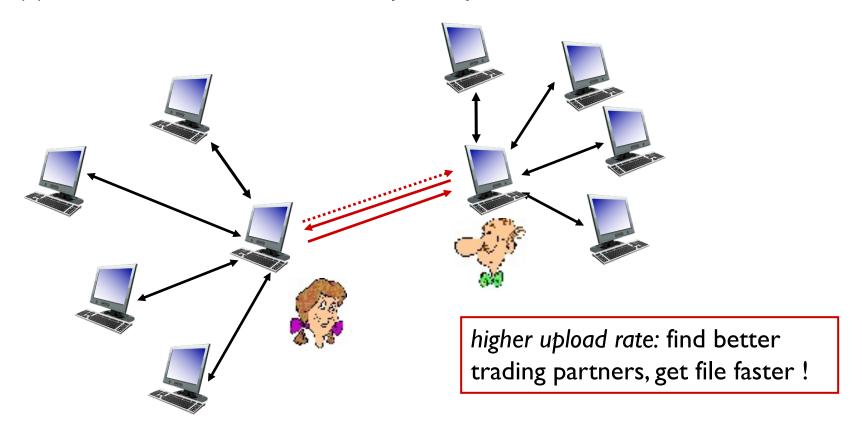

- at any given time, different peers have different subsets of file chunks
- periodically, Alice asks each peer for list of chunks that they have
- Alice requests missing chunks from peers, rarest first

sending chunks: tit-for-tat

- Alice sends chunks to those four peers currently sending her chunks at highest rate
 - other peers are choked by Alice (do not receive chunks from her)
 - re-evaluate top 4 every 10 secs
- every 30 secs: randomly select another peer, starts sending chunks
 - "optimistically unchoke" this peer
 - newly chosen peer may join top 4

BitTorrent: tit-for-tat

- (I) Alice "optimistically unchokes" Bob
- (2) Alice becomes one of Bob's top-four providers; Bob reciprocates
- (3) Bob becomes one of Alice's top-four providers
